NOTE: Locate correct coilover x-member position, measure 3" from rear body hole forward to center of tube as shown. Position tube 1/4" down from top of rail, clamp and tack in place, measure again before final weld.

NOTE: Mount the shock brackets on the housing with the center lines of the tubes parallel to the tube through the x-member. The housing should be 4" from the frame to adjust ride height.

NOTE: Position the rear end with equal distances on each side of the frame and 4" between the tip of the housing and the bottom of the frame as shown.
